Özgür Çebi

Unity Game Developer

Summary

Unity developer who takes a game from an empty project to a live product and stays with it. Six years across mid-core, hybrid-casual and hyper-casual titles, owning whatever the game needs — gameplay, physics, AI, networking, tooling. Works from modular architecture and its documentation outward, and automates what would otherwise be done by hand. Portfolio and gameplay footage at **ocebi.github.io**.

Experience

Spektra Games Istanbul, Turkey

Game Developer November 2023 – September 2026

Mobile racing studio with 100M+ downloads; worked on both of its flagship titles.

Highway Racer Pro — #1 Racing on the US App Store at launch in the US and 45+ countries, and the category's most-downloaded title since. Millions of players across iOS and Android, featured by Apple in "Games We Love".

- Started the project with the CTO as one of its first two engineers; worked across effectively every system through launch and live operation.
- Set the architecture, documentation and review standards for the codebase.
- Built the modular vehicle physics components behind the game's driving feel, plus the highway traffic simulation and racing AI.
- Built the deepest vehicle customization system in mobile racing — 45+ vehicles, 60+ part categories each, 4+ parts per category, five LODs per part — extracted from single-FBX sources into Addressables groups tuned so only what a scene needs reaches memory.
- Built an internal profiling tool that auto-captures memory and performance traces from scripted scenarios and runs AI analysis over them, surfacing regressions unattended.
- Built a native iOS and Android plugin exposing home-screen quick actions and app shortcuts into Unity.
- Designed the case study and ran technical interviews for the engineers hired as the team grew to four.

Parking Master Multiplayer 2 — live open-world driving title, 15M+ downloads.

- Shipped player-facing systems into a live title at that scale: character customization, multiplayer events, new game modes and a vehicle accessory system among them, whose police siren became the month's best-selling in-app purchase.
- Ran continuous memory and CPU optimization to hold smooth performance across low-end Android and iOS hardware.

KobGames Studios Remote, international team

Multiplayer Unity Developer August 2022 – August 2023

- Built *Kitties Metaverse*, a WebGL open-world title in Unity and Photon Quantum — 128 concurrent players per room, 4000+ characters assembled at runtime from NFT data.
- Developed a multiplayer hybrid-casual survival game on Photon Fusion, plus hyper-casual prototypes.

HoloNext Istanbul, Turkey

Unity Developer September 2020 – August 2022

- Shipped mid-core multiplayer titles *Hunt Heroes* and *RoboSquad* — gameplay, real-time networking, game AI, matchmaking, IAP and store release.
- Engineered the modular gameplay codebase behind 40+ hyper-casual prototypes, developing 27 shipped titles solo and supporting 15+ more as mentor or project manager.
- Scrum master and team lead for the hyper-casual team; also delivered WebGL and AR client work.

Skills

Unity & C#

- Addressables
- URP
- Profiling & Optimization
- Native iOS / Android Plugins

Multiplayer

- Photon Fusion / Quantum / PUN2
- FishNet
- Nakama / Hiro (client integration)

Live Ops & Platform

- PlayFab
- Firebase
- Ad SDKs
- IAP
- Analytics
- Store Release

Tooling & Automation

- Git
- Plastic SCM
- Jenkins CI/CD
- Internal Editor Tooling

Education

Yeditepe University BSc

Computer Engineering

Istanbul, Turkey • 2016 – 2021

Publications

Behavior Tree vs. Finite State Machine AI in Shooter Games

2021
